What's love got to do with it?

12 May 2026

Markets remain resilient despite geopolitical and political uncertainty, with oil prices, strong corporate earnings, and AI optimism supporting momentum. However, investor behaviour and rising UK political instability could influence sentiment and keep risks firmly in focus.

All missives currently begin with the caveat “at the time of writing”. I’ve noticed that many podcasters now ‘date stamp’ their conversations too. As I outlined in the latest Monthly Digest, the world in which we awake these days is not necessarily going to be the same one in which we went to bed. The main source of current uncertainty remains the situation in the Middle East, but domestic issues such as the travails of the Labour Party are influential. And if you turn in without checking the latest results from Wall Street’s biggest companies, then you are missing some late night fireworks too.

Where is the love?

The war in Iran remains ‘top of mind’ for now, mainly thanks to its influence on the price of oil and gas and related commodities. If you want to take delivery

Quick take:

- Oil pricing suggests easing tensions – but uncertainty is keeping investors cautious.
- Behavioural bias can hold investors back – in rising markets this risks missing long-term growth opportunities.
- Leadership uncertainty is increasing in the UK – political instability is a key watch point for investors.

of a barrel of oil today, it will cost you around \$108. But if you’re happy to wait until December, it will be \$88, at least based on futures prices. The market is signalling that some sort of agreement can be reached that will allow tankers to navigate the Strait of Hormuz again. The collective wisdom of the crowd is often (but certainly not always, in retrospect!) the best guide to the future.

Even so, the risk of a more negative outcome still restrains us from increasing equity weightings in balanced portfolios.

The value of investments can go down as well as up and you could get back less than you invested. Past performance is not a reliable indicator of future performance. This information should not be taken as financial advice or a recommendation.

Weekly Digest

That's been a bit frustrating as markets have continued to rise but represents, for us, the right balance of risk and reward. As written about previously, the effects of higher commodity prices take a while to feed through, and the world is still working its way through inventories. Should they run out, more stress will become evident.

In reality, we would hardly expect Iran and the US to kiss and make up. The future price of oil is going to reflect a degree of uncertainty as well as the need to rebuild the stockpiles that have been drawn down, amounting to around a billion barrels by now. We are also concerned that if there is no final agreement concerning Iran's nuclear capabilities, then the issue might rear its head again sooner, not later. Indeed, one of our geopolitical analysis providers fears that President Trump might kick the can no further down the road than November's mid-term elections before re-escalating. Suffice to say that we are constantly re-evaluating the situation.

Better to have loved and lost?

Behavioural science provides some very interesting insights into investing. Probably more than ever, given the cacophony of news and opinions that we are assailed with daily. As I often point out, the negative headlines are the ones that people listen to the most. And doomsayers

and bear market proponents also seems to garner more than their fair share. Indeed, I suspect someone in a newsroom somewhere has run the numbers on the increased levels of reader/viewer engagement when the world "crash" is introduced.

Three closely related theories are relevant to how one might consider one's biases: prospect theory, loss aversion and the endowment effect. Prospect theory, developed by Daniel Kahneman and Amos Tversky, concerns humans' attitude to the risk of loss against the potential reward of gain. They value gains and losses differently. The desire to avoid losses, or potential losses, outweighs the potential for gain. Within that theory, loss aversion posits that the negative emotional impact of loss is around twice the benefit of a gain.

The endowment effect is somewhat different. It holds that people value an object more because they own it. The classic study was that of students who were offered a mug and asked how much they would be prepared to pay for it. They were then given the mug for nothing but later asked how much they would be prepared to sell it for. The mere act of (fleeting) ownership meant that the average asking price was raised.

Think what this means for investing. If you are always worried about the market

going down, you'll never have sufficient confidence to invest enough to meet your objectives. And this is in a world where the long-term returns from equities empirically outweigh the possible loss of capital. That's not to say that there are no times when it's advisable to sell (or at least trim the sails). Often, the best time to sell is when a stock or market has peaked and is turning down. But this is where prospect theory kicks in, overcoming loss aversion. The owner holds out for last week's price, rather than focusing on the much larger gains that could still be banked.

Today, we have a potent narrative surrounding artificial intelligence combined with what is turning out to be one of the strongest corporate reporting seasons on record (notably for US companies). Not only that, but market earnings estimates for the whole of 2026 and 2027 are still rising. Of course, given the potential for events in the Middle East to turn against us, these estimates might not be sustainable, but it feels wrong to stand in the way of such positive momentum. It makes more sense to give back some future gains than never to make the gains in the first place.

Love's Labour's lost

Shakespeare's play of this title was a comedy. That hardly seems appropriate to the mauling experienced by the Labour Party at last week's local and mayoral

elections. Indeed, I find myself living in a borough (Hackney) that has just returned the UK's first ever directly elected Green Party mayor. It looks premature to be dusting off our general election playbook, but we certainly need to keep an eye on developments within the Labour Party. It's a widely held opinion that the departure of Prime Minister Keir Starmer (accompanied, inevitably, by Chancellor Rachel Reeves) would be viewed as a destabilising market event, likely to take policy further to the left.

The Polymarket betting site (a credible reflection of sentiment) shows a 46% probability of Starmer being out by the end of June. It was as low as 17% on Monday evening and as high as 65% on Tuesday morning. This is a volatile situation. The odds for a new leader (and PM) favour current Mayor of Manchester Andy Burnham, followed by Wes Streeting, the more centrist Health Secretary. Former Housing Secretary Angela Rayner is running third, followed by Energy Secretary and former party leader Ed Milliband.

The reaction to the election results on Friday was relatively muted. UK government bonds outperformed a little and sterling rose in value because the results were no worse than expected. This reaction may also have reflected that fact that the Green Party (now viewed as the

most left-wing major party) didn't really surprise to the upside. The emergence of a potential 'stalking horse' Labour leadership candidate, Catherine West, over the weekend took some of the gloss off on Monday morning, and market sentiment deteriorated throughout that day following various

However, he's widely regarded as significantly further to the left of Starmer.

resignations and more calls for Starmer to step aside. On Tuesday morning, investors continued to sell gilts and the pound in response to the increasing risk of destabilisation. These asset classes tend to be the most reliable weathervanes when it comes to evaluating political risk. Longer-dated gilt yields are making multi-decade highs, increasing the cost of debt

when the fiscal situation is already testing. The pound remains at the upper end of its trade-weighted post-Brexit trading range, suggesting no imminent crisis. But the situation is fragile.

There's little to suggest that an even more disruptive general election is imminent. With a huge Labour majority, it's improbable that a vote of no confidence could succeed. Especially when many current Labour MPs are at risk of losing their seats to Reform or Green Party candidates. And even if there was a general election, neither party is close to achieving an overall Parliamentary majority based on current polls – and that's before we take potential tactical voting into account. We'll definitely be publishing more thoughts on how this might all play out, but we could be waiting as long as three years for a general election.

Returning to Shakespeare's play, it follows three lords who swear an oath to fast and avoid women for three years to focus on their studies. Maybe Labour's leaders should similarly focus on getting on with doing a good job. The characters in the play are quickly led astray by the arrival of attractive ladies. At least hilarity ensues. The more politicians lose focus on their responsibilities to the electorate, the more it turns from a love story into a tragedy.

Weekly Digest

Regional highlights

UK. Retail sales fell by 3.4% in April from a year ago according to the British Retail Consortium, well below the expected 0.8% increase. The headline weakness is overstated owing to the fact that Easter fell much later in April last year, but the underlying figure was still negative (-0.2%). That's the worst performance since mid-2024, suggesting that higher energy prices are beginning to bite. And this is before the household energy price cap is raised in July, which will lead to higher bills. Inflationary pressures leave the Bank of England's hands tied when it comes to providing any relief. In fact, market pricing suggests three quarter-point base rate increases over the next year to 4.5%, with the first coming in July.

US. The resilience of the US economy was reflected in April's payroll data. Non-farm payrolls surprised to the upside in April, increasing by 115k (vs consensus forecast of 65k). That's well above the current breakeven rate which lies somewhere between zero and 50k. Growth was led by a gain in healthcare employment, but there were also better-than-expected gains in other sectors including retail and transportation. The drag from federal layoffs also seems to be easing (but still a drag). Information Services was the biggest jobs shedder and there have been

some high-profile layoff announcements recently. Managements are attributing the decisions to AI-related productivity but there's some debate as to whether that is just cover for dealing with past over-hiring. Markets are currently pricing in no changes in US interest rates over the next year.

Europe. The latest round of economic data in Europe has been generally disappointing. Europe is deemed to be at risk from the Middle East-related energy price shock, although it's not as severe as the one experienced in 2022. The shortfall against expectations, which were to some degree elevated owing to increasing optimism about fiscal expansion in Germany, can be seen in Citigroup's Economic Surprise Index which has fallen from +32 in February to -57. This series always mean-reverts to zero as expectations are recalibrated and might now be signalling close to maximum disappointment. As in the UK, the European Central Bank is more concerned with keeping inflation under control than boosting growth and market pricing here calls for three quarter-point deposit rate increases by year end, which would take the rate to 2.75%.

China. Inflation increased from 1% to 1.2% in April vs a forecast of 1%. Investors have been hoping for higher inflation in China, taking this as a sign that deflationary

Weekly Digest

overcapacity being utilised and that consumers are more willing to spend.

But the current increase might be for a more negative reason. Energy and related costs are rising owing to events in the Middle East. This pressure was reflected in the 2.8% year-on-year jump in producer prices, up from 0.5% in March. Service price inflation was more subdued at 0.9%.
